RESERVOIR DPI OVERVIEW

THE UNIT is a reservoir based Dry Powder Inhaler designed to hold up to 200 doses of inhalation powder such as Budesonide.

The cap twists off to reveal the mouthpiece. To advance the dose, the top half of the inhaler is rotated relative to the bottom half by approximately 180 degrees. When twisted back, a counter mechanism displays doses remaining.

Bypass airways ensure that the inhalation effort meets regulation requirements

When all doses are delivered, the system locks out such that it cannot deliver any remaining powder.

The dose counter can be factory set to restrict the delivery to fewer doses if required.

A desiccant can be incorporated in the lid if required.
